Full Scan report — d***@example.com

Digital Footprint Analyzer · report schema dfa-report-v1

Assessment

Scan	Full Scan
Target	d***@example.com
Status	PARTIAL
Started	2026-11-03T10:00:00Z
Finished	2026-11-03T10:00:05Z
Report generated	2026-11-03T13:02:06Z

Exposure score: 48 / 100 · Moderate
Raw points: 23.0 · confidence: medium
Methodology: exposure-v1

Critical: 0 **High**: 1 **Medium**: 1 **Low**: 0 **Info**: 0

Findings summary

Distinct issues	2
Confirmed	2
Reported, unverified	0
Inconclusive	0
Coverage notes	0
Modules that failed	0
Checks unsupported here	0

What this assessment does not cover

- These modules did not provide usable coverage, so findings from them are unknown: File.

How this score was calculated

Distinct issues	2 distinct issue(s) after merging duplicate findings from 2 reporting module(s).
Severity weight	23.0 point(s) from severity weights (Critical 25, High 15, Medium 8, Low 3, Info 1) scaled by evidence confidence (verified 1.0, provider-reported 0.5, unconfirmed 0.5).
Coverage	2 of 3 module(s) produced usable coverage; gaps: File.
Methodology	exposure-v1: index = round(100 x (1 - e^(-points/35))), capped at 3 issues per rule.

Module coverage

A module that did not complete cannot clear a finding, and its findings are unknown rather than absent.

System	Completed	Synthetic demo data
Browser	Completed with limitations	Synthetic demo data; one profile
File	Skipped — not covered	No file selected in this demo

Findings

[High] Demo address appears in a breach data set

email · Email Breach · provider-verified · confidence: high · Unremediated

A synthetic demo address appears in a simulated breach record. This is sample data, not a real lookup.

Why it matters: The address appears in a breach data set. Credentials exposed in old breaches are still reused, so an old leak can open a current account.

- emails: 3

[Medium] Demo browser extension can read browsing data

browser · Browser Extension · direct-observation · confidence: high · Unremediated

A simulated extension has broad permissions. Review extensions you do not recognise.

Why it matters: This record was collected from your own device or from a public source and is listed so you can review it.

- extension: Demo Helper 1.0
- permissions: tabs, history

Recommended actions

Marking an action complete is your own record; it is not a technical verification that the issue is gone.

High — Change the exposed password for this account

Credentials leaked in a breach stay useful to attackers for years, because people reuse passwords across services.

1. Sign in to this account and change the password to one you have not used anywhere else.
2. Change that same password on every other account that used it.
3. Turn on two-factor authentication for the account.
4. Review the account's recent activity and signed-in devices for anything you do not recognise.

- Have I Been Pwned — check an address against known breaches — https://haveibeenpwned.com/
- CISA — use strong passwords — https://www.cisa.gov/secure-our-world/use-

strong-passwords
- CISA — multi-factor authentication — https://www.cisa.gov/mfa

About this report

- Generated locally on this device from a single scan. No data was sent anywhere to produce this report.
- Evidence is shortened and sensitive values (credentials, tokens, full file paths, email local parts) are masked. Re-run the scan for the raw values.
- Only the modules listed under coverage ran. Anything they cannot see was not assessed.
- Not detecting a finding is not evidence that the exposure does not exist.
- Findings that a provider merely reported are leads until you verify them.
